

# WASM Resource Hog & Monitor

Christopher Davisson

Computer Science & Cyber Defense

May 27, 2025

# Introduction

- **Monitor**
  - Measure CPU usage per tab
  - Include Memory, network, GPU memory, # of web workers
- **WASM Resource Hog**
  - Basic resource exhaustion attack
    - Just CPU for now, I'm working on memory
  - Obfuscate and try to get around defenses
    - Implement dynamic behavior
    - Implement threading to capture more than one core

# Monitor

- Currently just CPU is being measured

## Per-Tab CPU Usage

- |    |      |         |                  |
|----|------|---------|------------------|
| 1. | none | PID: 9  | <b>CPU:</b> 4.6% |
| 2. | none | PID: 11 | <b>CPU:</b> 1.3% |
| 3. | none | PID: 15 | <b>CPU:</b> N/A% |
| 4. | none | PID: 16 | <b>CPU:</b> N/A% |
| 5. | none | PID: 19 | <b>CPU:</b> N/A% |

# Monitor Code

Demo

# Hog

- Currently only have basic CPU hog working
  - Only functions on one core
  - Demo resource monitors catching it

## Per-Tab CPU Usage

1.	none	PID: 9	<b>CPU:</b> 0.0%
2.	none	PID: 11	<b>CPU:</b> 0.0%
3.	none	PID: 15	<b>CPU:</b> 0.0%
4.	none	PID: 19	<b>CPU:</b> 100.6%
5.	none	PID: 32	<b>CPU:</b> 0.0%
6.	none	PID: 33	<b>CPU:</b> 0.0%

```
1 void cpu_hog_for_seconds(double seconds) {  
2     double start = emscripten_get_now();  
3     volatile double x = 0.0001;  
4     // spin until duration elapses  
5     while ((emscripten_get_now() - start) < seconds * 1000.0) {  
6         x += x * 1.0000001;  
7     }  
8 }
```
